

PAVAN KUMAR ETTA

SAN JOSE, CA | +1 (508)-863-0500 | pavankumar.etta02@gmail.com | [GITHUB](#) | [LINKEDIN](#) | [PORTFOLIO](#)

PROFESSIONAL SUMMARY

M.S. graduate in Computer Information Science with 3+ years of Software Engineering experience building backend services, distributed systems, cloud infrastructure, and storage-backed applications using Python, Go, C++, AWS, Kubernetes, SQL, Redis, and object storage. Experienced in production deployments, data reliability, fault-tolerant system design, and performance optimization.

SKILLS

Programming: Python, JavaScript, TypeScript, C/C++, C#, Java, Go
Backend & APIs: Django, Flask, FastAPI, REST APIs, gRPC, GraphQL, Event-Driven Architecture, System Design
Web Tools: jQuery, Angular, Node.js, Vue.js, Next.js, Flutter, Nginx, Figma, HTTPS
Databases & Caching: PostgreSQL, MySQL, DynamoDB, MongoDB, Redis, Elasticsearch
Cloud & Infra: AWS (Lambda, EC2, S3, RDS, MSK, EKS), GCP, Azure, Terraform, Serverless
Data Engineering: Apache Spark, PySpark, Airflow, Snowflake, Hadoop, dbt
DevOps & Observability: Docker, Kubernetes, CI/CD, GitHub Actions, GitLab CI, Jenkins, Prometheus, Grafana

WORK EXPERIENCE

Graduate Research Assistant | University of Massachusetts, Dartmouth | USA Mar 2025 – Dec 2025

- Architected a Next.js-based web application with a Flask backend and MongoDB, enabling users to upload financial documents and view detailed reports generated through an NLP pipeline.
- Integrated LangChain for AI workflow orchestration and optimized ChatGPT-based text extraction, improving extraction accuracy by 30%; implemented BERT-based classification with 93% accuracy.

Software Engineer II | Rhenix Lifesciences LLP | India Aug 2021– Aug 2024

- Automated daily health-data retrieval, reducing collection effort by ~90%, by building Python ingestion jobs and Django commands on EC2 to manage authentication, refresh tokens, parse JSON, retry failed requests, and store validated records.
- Built iOS, Android, and web features for the CureOrg platform, enabling patients to link 5+ wearables and view daily heart rate, sleep, steps, calories, activity, distance, and elevation metrics through Fitbit, Garmin, Withings, and Apple Health integrations.
- Improved research-data reliability by converting 5-second heart-rate signals into 1-minute windows using SQL, validating API data, handling missing records, and storing metrics in MySQL on AWS EC2.
- Reduced sync debugging time by ~40% by building internal monitoring views with validation logs and AWS CloudWatch alerts to identify failed API calls, delayed jobs, and missing records faster.
- Enhanced health-metrics dashboard performance by up to 70% by optimizing Django REST API responses, MySQL query patterns, indexing, pagination, and Redis caching for frequently accessed user metrics.
- Accelerated backend and dashboard deployments by 80% by containerizing services with Docker and automating production deployments on AWS EKS using GitLab CI/CD pipelines.

Software Engineer Intern | Cure Science Institute | USA Jun 2021 – Aug 2021

- Developed a BLE-based asset tracking system using an Android app, BLE beacons, gateways, and REST APIs, enabling real-time location data uploads to AWS S3 with persistent background services for 24/7 tracking and improved battery efficiency.
- Built an admin analytics dashboard using React, Google Maps, AWS API Gateway, DynamoDB & RDS, CloudWatch, and scheduled jobs to monitor device health, visualize coordinates, detect offline gateways, and analyze asset movement patterns.

PROJECTS

Distributed API Gateway & Rate Limiting Service [\[GITHUB\]](#) (Python, Go, AWS, Redis, Docker, Kubernetes)

- Designed a **cloud-native API** gateway with authentication, request routing, rate limiting, retries, circuit breakers, and service-level observability, improving backend reliability and protecting microservices from traffic spikes.

Fault-Tolerant Sharded Key-Value Store [\[GITHUB\]](#) (C++, Raft, SQLite)

- Engineered a fault-tolerant sharded key-value store in C++ using **Raft** consensus and SQLite, implementing replicated state machines across multiple servers to maintain consistency, support failure recovery, and achieve 94.99% availability.

Wandermate [\[GITHUB\]](#) (React, TypeScript, Node.js, MongoDB, Socket.IO)

- Developed a full-stack travel platform using React, TypeScript, Node.js, and MongoDB, integrating Socket.IO for real-time messaging, PropelAuth for secure authentication, Mapbox for interactive maps, and reusable APIs for third-party integrations.

Trip Planner [\[GITHUB\]](#) (React.js, TypeScript, Go, DynamoDB, React Native, AWS)

- Designed and deployed a full-stack trip-planning platform using React, TypeScript, Go, DynamoDB, AWS Amplify, and Google Places API to generate personalized itineraries and sync them with a React Native mobile app for on-the-go access.

EDUCATION

University of Massachusetts, Dartmouth GPA: 4.0	North Dartmouth, USA
M.S. in Computer Information Science, Data Science	Aug 2024 - May 2026
Indian Institute of Information Technology GPA: 3.2	SriCity, INDIA
B.Tech in Electronics and Communication Engineering	Aug 2017 - June 2021
